Schedule

Time	Activity
5:00 PM - 5:15 PM	Introduction to the workshop
5:15 PM - 5:30 PM	Session 1: What is Blockchain?
5:30 PM - 5:45 PM	Coffee Break (15 minutes)
5:45 PM - 6:15 PM	Session 2: How does Blockchain work?
6:15 PM - 6:30 PM	Coffee Break (15 minutes)
6:30 PM - 7:00 PM	Session 3: Applications of Blockchain
7:00 PM - 7:15 PM	Session 4: Conclusion

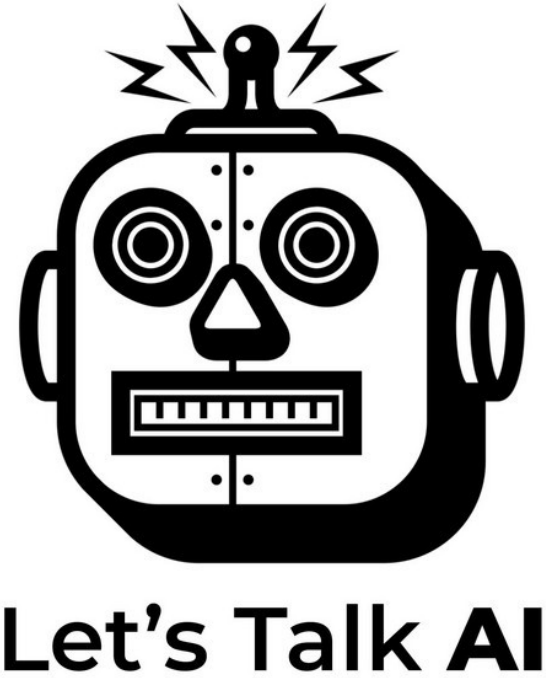
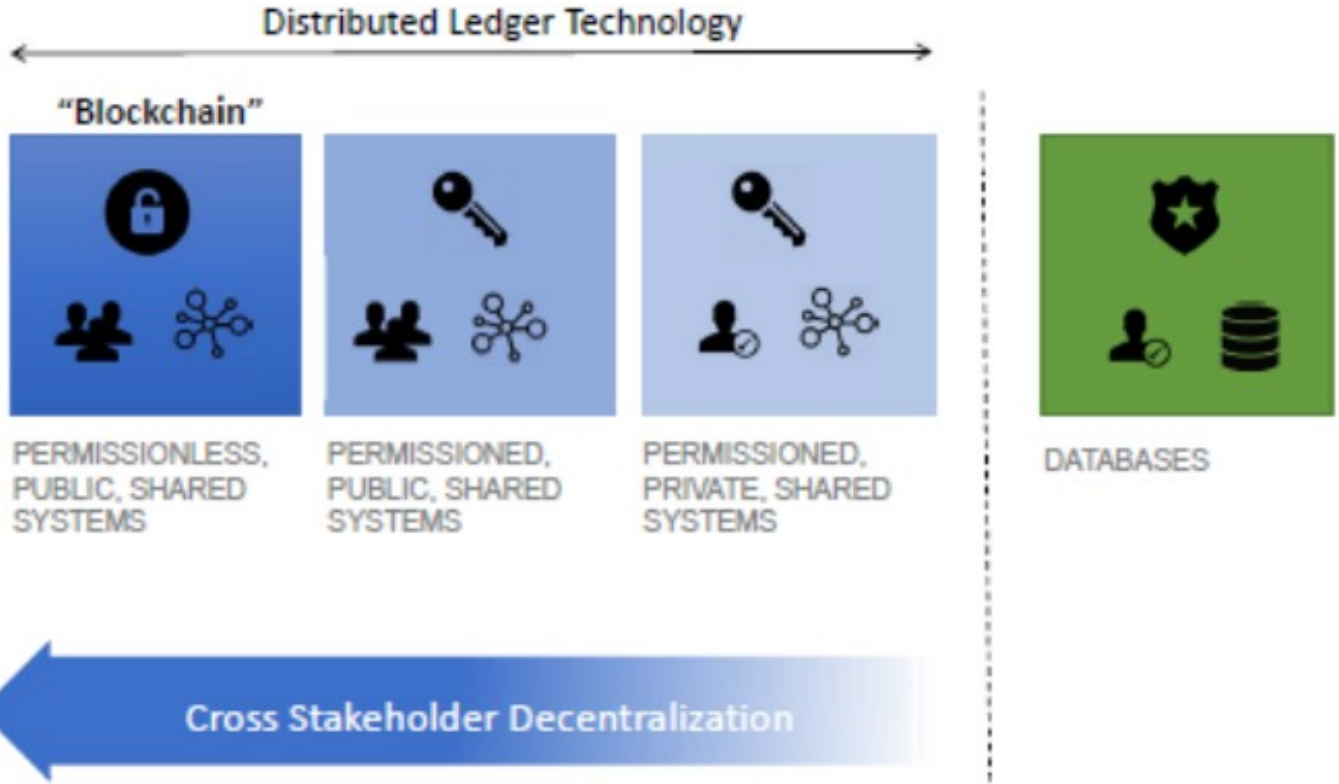
Introduction

- Blockchain, as a distributed ledger technology (DLT), has an interesting history that spans several decades.
  - So, let's ask AI?
    - **Prompt>** Hello AI, what is a Distributed Ledger Technology (DLT)? Step by Step
    - **Prompt>** Thank you AI, can you explain the history of the evolution of Blockchain as a Distributed Ledger Technology (DLT)? Step by Step
    - **Prompt>** Thank you AI, can you give me a definition of Blockchain?





Imperial College London

Chainlink

What is Blockchain?

DEFINITION

A blockchain is a highly secure and reliable network that records data in a distributed ledger that is not controlled by a central authority.

What is the purpose of Blockchain?

In all our agreements today, we have this issue of trust and promises.

All these have trust assumptions

Source: https://patrickalphac.medium.com/why-we-web3-bd21a5570019

Chainlink

What is the purpose of Blockchain?

- “Unbreakable Promises”
  - Blockchain technology allows us to create agreements and promises that are effectively unbreakable, similar to the childhood ritual of the pinky swear.
  - Just as the pinky swear signified an unbreakable vow between friends, blockchain provides the tools to make trusted, permanent agreements.
  - Blockchain gives us the capability to establish commitments that do not require absolute trust between parties.
  - In a sense, we now have the technology to make pinky swears - symbolic unbreakable promises - actually binding and permanent.
  - Blockchain enables “**trust-minimized agreements**” that were not feasible before.

Source: https://en.wikipedia.org/wiki/Pinky_swear

Chainlink

What is the purpose of Blockchain?

- “Trust. Minimized. Agreements”
  - **Nick Szabo:** The man, the myth the legend.
  - His paper on Bit Gold and his conception of smart contracts. Bit Gold is seen as the precursor to bitcoin, which **Satoshi Nakamoto (pseudonym)** would go on to refine in **his/her/they** bitcoin whitepaper.
  - **Smart contracts**, Szabo first wrote about back in 1996, enable the execution of cryptocurrency transactions and underpin the viability of the entire field.
  - His philosophy as a whole – is the concept of ‘**trust-minimisation.**’ This posits the theory that, as a species which is optimised to best function in groups of no more than 150 individuals, we need to develop ways in which the need to trust strangers is kept to a minimum.
  - Quite simply, there wouldn’t be crypto without Nick Szabo’s work.

Source: https://www.coinbureau.com/analysis/who-is-nick-szabo/

What is the purpose of Blockchain?

- “Cryptographic Truth”
  - **Sergey Nazarov:** co-founder of Chainlink, a leading decentralized oracle network.
  - His thesis: Cryptographic truth will reshape societal agreements.
  - Blockchain technology creates a tamper-proof ledger.
  - Cryptographic truth can revolutionize trust and enforcement of agreements.
  - Benefits: Increased security, efficiency, transparency and accessibility.
  - Applicable to various domains: finance, supply chains, voting systems, legal contracts.
  - The 4 pillars of good goverance.
  - Sergey Nazarov and former Google CEO Eric Schmidt discussing the future of **Web3**.

Chainlink

What is a Smart Contract?

DEFINITION

A smart contract is a tamper-proof program that runs on a blockchain network when certain predefined conditions are satisfied.

- A smart contract is an agreement that is deployed to a decentralized blockchain, and unlike traditional agreements, once a smart contract is deployed, it:
  - Cannot be altered (is immutable)
  - Automatically executes
  - Everyone can see the terms of agreement

Source: https://chain.link/education/smart-contracts

Chainlink

What is SHA-256?

A secure hashing algorithm or commonly referred to as SHA-256, is an unkeyed cryptographic hashing function that takes an input of variable length and produces a 256-bit long hash output.

Uses of SHA-256 in blockchain

SHA-256 is one of the first and most prominently used hashing algorithms in blockchains like Bitcoin, Bitcoin Cash, and Bitcoin SV. SHA-256 is used in various stages in a blockchain, most prominently:

- **Consensus mechanism:** Miners calculate the hash of new blocks to be created using SHA-256 by varying the value of nonce in a bitcoin block until they reach the hash below the threshold. Then that block can be accepted into the ledger.
- **Chains of blocks:** Each block in the ledger contains a hash generated by SHA-256 referring to the preceding block in the chain.
- **Digital signatures:** Transactions use digital signatures to maintain integrity, the information used in the transaction is hashed using SHA-256, and then it is encrypted with the sender's private key to generate a signature. The miner then verifies this signature to validate the transaction.

Cryptographic Truth is Strictly Better than “Just Trust Us”

”Just Trust Us” Paper Promises

- Control is completely given away
- Counterparty risk is high and opaque
- Transparency is purposefully removed

Cryptographic Truth Guarantees

- Control is in the user’s hands
- Counterparty risk is low and transparent
- Transparency is unavoidably built-in

Chainlink

How does Blockchain work?

- The 4 Generals Problem and Byzantine Fault Tolerance are two concepts related to distributed systems and consensus algorithms.
  - So, let’s ask AI?
    - **Prompt>** Hello AI, can you explain the relativity of the 4 generals problem and Byzantine Fault Tolerance to how Blockchain works? Step by Step
    - **Prompt>** Thank you AI, can you give me a breakdown of how blockchain works? Step by step

Blockchain in the UAE government

Blockchain is a shared immutable real-time ledger for recording the history of financial transactions, contracts, physical assets, supply chain info, etc. The UAE Government adopted blockchain technology in conducting its transactions. To aid this move, it launched the Emirates Blockchain Strategy 2021 and Dubai Blockchain Strategy. Dubai Future Foundation established the Global Blockchain Council to explore, discuss current and future applications and organise transactions through the blockchain platform.

AWARENESS.

"Dubai [will be] the first city fully powered by Blockchain"

3 strategic pillars
Government Efficiency,
Industry Creation,
International Leadership.

دبي الرقمية
DIGITAL DUBAI

Dubai wants to become a global tech hub – and it's betting on crypto to get it there

Mena region is 'world's fastest-growing cryptocurrency market'

Dubai's Future Blockchain Summit to create global business opportunities for Web3 innovators

UAE's Future Blockchain Summit to address all things Blockchain in Dubai from tomorrow

DUBAI METAVERSE STRATEGY

Objectives

x5

To the number of blockchain and metaverse companies in 5 years

40K

Metaverse to support 40,000 virtual jobs and add $4 billion to Dubai's economy in 5 years

#1

Become #1 in the region and one of top 10 cities globally in terms of metaverse economy

Pillars

Foster Metaverse Innovation and Experience Certification

Cultivate Metaverse Talent Through Education and Training

Develop Metaverse Businesses and Applications in Dubai Government

Adoption, Scaling and Global Advocation of Web Platforms

Infrastructure and Regulation Refinement

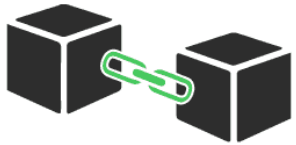
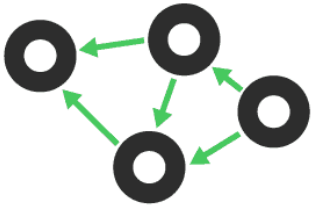
Conclusion

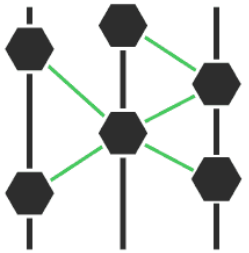
Types Of Distributed Ledger Technologies



Blockchain



Directed Acyclic Graph



Hashgraph

Distributed Ledger Technologies Compared

	 Blockchain	 DAG	 Hashgraph
Transactions per second	7	Potentially unlimited	250,000+
dApps support	Yes	No	No
Tested under real market conditions	Yes	Yes	No
Patented	No	No	Yes

CryptoManiaks
Master the Crypto World

Chainlink

The Properties of Distributed Ledger Technology (DLT)

Programmable
A blockchain is programmable (i.e. Smart Contracts)

Distributed
All network participants have a copy of the ledger for complete transparency

Secure
All records are individually encrypted

Immutable
Any validated records are irreversible and cannot be changed

Anonymous
The identity of participants is either anonymous or pseudonymous

Unanimous
All network participants agree to the validity of each of the records

Time-stamped
A transaction timestamp is recorded on a block
